Border control (Entry-Exit)
Document capture and biometrics

Sucess story

The European Union has established the need to implement the Entry-Exit System (EES) in order to strengthen border control of third-country nationals entering Europe through the external borders of the Schengen area.
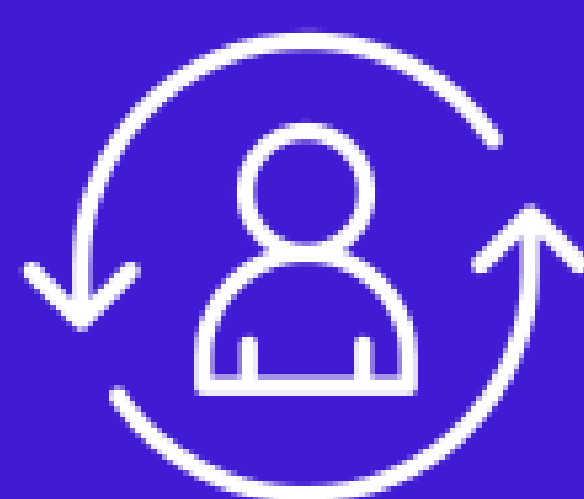

Thus, Member States are obliged to adjust their border management procedures, train their staff, and improve the infrastructure at border entry points.

Mobbeel, together with SIA, has integrated **kiosks** (Self-Service System) and e-gates at **multiple airports in Spain and Italy**. The solution allows the **identification of registers** and facilitates communication with the airport's passenger management systems to validate passenger and trip data.

The process is simple for the user. They approach one of the kiosks to collect passport information and perform a facial recognition process, which detects individuals who are not authorised to enter the Schengen area.

Automatic border control

Better Passenger experience

Identity theft detection
